

Understanding Stem Cell Research

As you know, Joni Eareckson Tada is excited about the many new medical therapies which are currently being developed using adult stem cells.

Like many Americans with disabilities, Joni is convinced that the quickest, most cost effective, safest, most promising, and most ethical route to cures for diseases is through medical treatments using stem cells derived from adult or neo-natal tissue (umbilical cord blood) rather than stem cells harvested from human embryos. Eventually, these new medical adult stem cell therapies will touch the lives of the thousands of disabled children, adults and their family members, including those whom we serve through Joni and Friends.

For a current listing of the most recent advancements using adult and neo-natal stem cells, we invite you to visit the following web site: www.stemcellresearch.org
